                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               misc_feature
their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://fp.genome.washington.edu/RW/RepeatMasker.html). Regions of genomic Sequence that are not annotated as genes but have predicted exons by GRAIL are annotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /PDCCEDI__d="AAC24175.1"

                                                                                              FEATURES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur-pen.orn.javo), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene/Cabsetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html).
Annotated genes are named to indicate the level of evidence for their annotation. Genes without significant peptide after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy/tRNAscan-SE). Simple repeats are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thale cress.

identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/RepeatMasker.html). Regions of genomic sequence that are not annotated as genes but have predicted exons by GRAIL are annotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          complement(1944. .2045)

Direct Submission

AL Submitted (02-APR-1998) Chromosome 6 Project Group

(http://wwwsanger.ac.uk/HGP/Chr6/) Sanger Centre, Hinxton,

Cambridgeshire, CB10 13A, UK. E-mail enquires:

humquery(Sanger.ac.uk Clone requests: clonerequest(sanger.ac.uk

On Apr 8, 1998 this sequence version replaced gi:2505919.

IMPORTANY: This sequence state compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

variations annotated may not be found in the sequence submission

corres; anding to the overlapping clone as we submit sequences with

only a small overlap as described above.

This sequence was generated from part of bacterial clone contigs of

human chromosome 6 mapping group and loannis Ragoussis, Futther

information can be found at http://www.sanger.ac.uk/HGP/Chr6/ This

sequence has been finished according to sequence map criteria as

infollows. An attempt is made to resolve all sequencing problems,

such as compressions and repeats, but not necessarily within known

annotated human repeat sequence elements (e.g. Alu). Where the

feature key.
                                                                                                                                                                                                                                                                      Homo sapiens DNA sequence from PAC 179N16 on chromosome 6p21.1-21.33. Contains the SAPK4 (MAPK p38delta) gene, and the alternatively spliced SAPK2 gene coding for CSaids binding protein CSBP2 and a MAPK p38beta LIKE protein. Contains ESTs, STSs and two predicted CPG islands, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The true left end of clone 179N16 is at 1 in this sequence. The true right end of clone 524E15 is at 690.

The true left end of clone 179N16 is at 172048.

The true left end of clone 179N16 is at 172048.

The true left end of clone 179N16 is at 172048.

```
Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence similarities were identified using Powerblast by Jinghui

prediction programs including GRAIL (available by anonymous ftp from arthur.epm.orn.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene./cbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypotherical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Chankascan-SE). Simple repeats are hittp://denome.wustl.adv/eddy/tRNAscan-SE). Simple repeats are hittp://denome.wustl.adv/eddy/tRNAscan-SE).

                                                                                                                                                                                                                                                                                                                                                                                                                              St., Albany, CA 94710, Used to the Lypession center, but Buchanan on oct 24, 1998 this sequence version replaced gi:3406036.

This sequence is of BAC F15K9 from Arabidopsis thaliana chromosome in the sequence does not represent the sequence of the entire insert of this clone. It is shorter by 26,439 bp because we submit only the unique sequence of the clone. In order to facilitate the joining of overlapping clones in the future for creation of larger contigs, we provide a small overlap (200 bp) between overlapping submitted clones. The 5' end of this sequence overlaps by 200 bp the 3' end of the sequence of BAC F21B7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note="Contains similarity to gb|AB011110 KIAA0538 protein from Homo sapiens brain and to phospholipid-binding domain C2 PF|00168. complify the IL-1-alpha (IL-1-alpha) primers 2 and 1 (V12389) were used to amplify the IL-1-alpha gene region to identify single base variation of polymorphism of c/T at base 889. The invention claims to provide a method for predicting the risk of sight threatening diabetic retinopathy. The method involves isolating DNA from a patient and determining the DNA polymorphism pattern of the genes that code for interleukin-1-alpha, interleukin-1-beta and interleukin-1RN. The polymorphic pattern interleukin-1-beta and interleukin-1RN. The polymorphism patterns thereby identifying patients carrying a genetic polymorphism patterns thereby identifying patients carrying a genetic polymorphism sosociated with increased risk of sight threatening diabetic retinopathy. The method may be able to identify diabetic patients at risk before the clinically detectable disorders occur. Polymorphism pattern clinically detectable disorders occur. Polymorphism pattern (V12398). The method is also claimed to be useful in conjunction with retinopathy in genesi navolved PCR reactions using primers V32389. Continued to the useful in conjunction with retinopathy in genomic DNA and therefore, in identifying diabetic patients expressing multiple risk patterns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human 7-transmembrane receptor polypeptide, HWTMF81 encoding cDNA. Claim 3; Pages 17-18; 20pp; English.

The present sequence encodes a human 7-transmembrane receptor protein designated HWTMF81. HWTMF81 polypeptides and polynucleotides can be used in the treatment of infections such as bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2. They can also be used to treat pain, cancers, anorens, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, hypertrophy and psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias such as Huntington's disease or Gilles della Tourett's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The tumour rejection antigen precursor (TRAP) is processed to a tumour rejection antigen precursor (TRAP) is processed to a tumour rejection antigen (TRA) presented by HLA-A2 molecules. TRA is used to generate cytotoxic T lymphocytes for treating cancer (esp. melanoma). It can also be used to raise specific antibodies, and when complexed with HLA-A2, it can be used to prduce vaccines. Cytotoxic T lymphocytes so generated can be used in adoptive transfer or generated, or they can be generated in vivo by using vector containing the appropriate gene or using TRA or TRAP together with an adjuvant that facilitates entry into HLA-A2 presenting cells. T photoprotective or antioxidammatry agents
Claim 6: Fig 5A-C: 40pp: English.

This DNA sequence corresponds to the gene encoding a novel 39 kDa ferulic acid esterase (FAE, see W56728) of Aspergillus niger. It was isolated from A. niger genomic DNA using a partial gene fragment (see V28496) as probe. The invention provides vectors that include the DNA sequence, host cells transformed with the DNA or vectors, fermentation broths comprising such host cells, and esterase proteins expressed by the host cells. The FAE can cleave the ester linkage of phenolic esters. It can be used in a claimed cet esteries. FAE gene fragments can be used as probes to isolate homologous sequences having esterase activity.

Claim 1; Page 569-573; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences

C f the Invention. The DNA sequences are recorded on a computer readable

C medium, preferably selected from a floppy or hard disk, random access

memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using

CC the Staureus DNA sequences allows putative functions to be assigned so

that protein-encoding or regulatory regions of commercial, therapeutic or

industrial importance can be obtained. Specifically, sequences which are

consistent to encode antigens have been identified and these polypeptides can

be used in a vaccine composition against S. aureus infection. The

colypeptides can also be used in a kit for the immunodetection of

colypeptides can also be used in a kit for the immunodetection of

Claim 1, Page 1412-1415; 2084pp; English.

A computer readable medium has been developed which his recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for inagnosing Enterococcus faecalis in samples. They can also be used for inagnosing Enterococcus faecalis, or commercial intection in an animal and monitoring collises on of disease, and for identifying agents which can be used to another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal

Claim 4; Page 41-51; 111pp; English.

This cDNA clone codes for novel murine 150 kDa cell surface metastasis-associated antigen (see Wil866), designated p150. The protein was identified by raising antisera to membrane associated proteins and assessing cross-reactivity with transformed sociated proteins and assessing cross-reactivity with transformed associated proteins and assessing cross-reactivity with transformed cost cells. An oligonuclectide based on an isolated peptide of p150 was then used to screen a mouse melanoma B16F1 library, yielding a partial p150 cDNA clone. The missing 5' sequence was chained by RACE. The CDNA sequence (see T93627) of the human homologue of p150 (see Wil867) was also obtained. A claimed method for determining the metastatic potential of a tumour cell comprises of assessing the level of p150 expression in the cell, a higher level of p150 expression in the cell, a higher level of p150 expression and consequently a higher metastatic potential. Claimed p150 nucleic acids can be used in the recombinant production of p150 polypeptides, as well as in methods for the diagnosis and sequence 5137 BP; 1164 A; 924 C; 1355 G; 1194 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 15; Page 108; 209pp; English.

The present sequence, a transforming growth factor beta (TGF-beta) binding ligand, was identified by Systematic Evolution of Ligands by Exponential enrichment (SELEX). Briefly a candidate mixture of nucleic acids was contacted with TGF-beta, and nucleic acids having an increased affinity to TGF-beta partitioned from the maplified to yield a mixture of nucleic acids enriched for amplified to yield a mixture of nucleic acids enriched for sequences with higher affinity and specificity for binding to sequences with higher affinity and specificity for binding to sequences with higher affinity and specificity for binding to epithelial cell proliferation, or in the diagnosis and treatment of TGF-beta mediated pathological conditions, e.g. fibrotic conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gold L, Janjic N, Pagratis N, Ringquist S, Toothman PJ; WPI; 97-034387/03. Identification of nucleic acid ligands to TGF-beta, PDGF and hKGF using SELEX, used in the diagnosis and treatment of proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence, a transforming growth factor beta (TGF-beta) binding ligand, was identified by Systematic Evolution of Ligands by Exponential enrichment (SELEX). Britefly a candidate mixture of nucleic acids was contacted with TGF-beta, and nucleic acids remainder of the mixture. The partitioned nucleic acids were then samplified to yield a mixture. The partitioned nucleic acids were then sequences w. In higher affinity and specificity for binding to TGF-beta. The ligand is anti-mitogenic and may be used to inhibit epithelial cell proliferation, or in the diagnosis and treatment of TGF-beta mediated pathological conditions, e.g. fibrotic conditions such as fibrotic conditions.

The present sequence, a transforming growth factor beta (TGF-beta)

The present sequence, a transforming growth factor beta (TGF-beta)

binding ligand, was identified by Systematic Evolution of Ligands

by Exponential enrichment (SELEX). Briefly a candidate mixture of

nucleic acids was contacted with TGF-beta, and nucleic acids

having an increased affinity to TGF-beta partitioned from the

cemainder of the mixture. The partitioned nucleic acids were then

amplified to yield a mixture of nucleic acids enriched for

captences with higher affinity and specificity for binding to

TGF-beta. The ligand is anti-mitogenic and may be used to inhibit

cepithelial cell proliferation, or in the diagnosis and treatment of

TGF-beta mediated pathological conditions, e.g. fibrotic conditions

such as fibroids of the kidney, lung and ilver and more acute

conditions such as dermal scarring and restenosis.

Claim 15; Pages 108-109; 209pp; English.

The present sequence, a transforming growth factor beta (TGF-beta)

Chinding ligand, was identified by Systematic Evolution of Ligands

by Exponential enrichment (EEEEX). Briefly a candidate mixture of

nucleic acids was contacted with TGF-beta, and nucleic acids

having an increased affinity to TGF-beta partitioned from the

remainder of the mixture. The partitioned nucleic acids were then

amplified to yield a mixture of nucleic acids enriched for

sequences with higher affinity and specificity for binding to

TGF-beta. The ligand is anti-mitogenic and may be used to inhibit

cepithelial cell proliferation, or in the diagnosis and treatment of

TGF-beta mediated pathological conditions, e.g. fibrotic conditions

such as fibroids of the kidney, lung and restenosis.

Conditions such as dermal scarring and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identification of nucleic acid ligands to TGF-beta, PDGF and hKGF using SELEX, used in the diagnosis and treatment of proliferative

CC by Exponential enrichment (SELEX). Briefly a candidate mixture of concleic acids was contacted with TGF-beta, and nucleic acids having an increased affinity to TGF-beta partitioned from the remainder of the mixture. The partitioned nucleic acids were then concerned to yield a mixture of nucleic acids enriched for amplified to yield a mixture of nucleic acids enriched for consequences with higher affinity and specificity for binding to consistent and is anti-mitogenic and may be used to inhibit consistent and is anti-mitogenic and may be used to inhibit consistent and proliferation, or in the diagnosis and treatment of TGF-beta mediated pathological conditions, e.g. fibrotic conditions contains of the Xidney, lung and liver and more acute conditions such as fibroids of the Xidney, lung and restenosis.

CC Such as fibroids of the Xidney, lung and restenosis.

CC conditions such as dermal scarring and restenosis.

CC conditions such as dermal scarring and restenosis.

UI-R-A1 and UI-R-E1 libraries. The UI-R-A1 library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, and ut lung, brain, liver, kidney, heart, spleen, ovary, and muscle. The UI-R-E1 library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dI track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C1) was constructed as follows: PCR amplified cDNA inserts from UI-R-C0 clones from which 8. ESTs had been derived was used as a driver in a hybridization with the UI-R-C0 library in the form of single-stranded circles. The remaining single-stranded circles. The remaining single-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-C1 library. This procedure has been previously described, when a contract of contracts the UI-R-C1 library. This procedure has been previously described.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDNA Library Arrayed by: Greg Lennon, Ph.D.

                                                                                                                                                                                                                                                                                                                                         ö
               double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT773 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatima Bonaldo. RNA was kindly provided by Br. Minoru Ko (Mayne State University)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AV026016 149 bp mRNA EST 02-JUN-1999
